In today's data-driven business environment, understanding how different types of database management systems work is essential. Knowing what makes each database type unique helps decision-makers choose the right technology for their organizations. One notable type is the object-oriented database (OODB), also called ODBMS (object database management system), which offers unique advantages like better data organization and easier updates. These benefits can lead to more efficient operations and improved decision-making across the entire business.

Let's
